

gensysToAMA: A Matlab Implementation of the Anderson-Moore Algorithm Using **gensys** Input and Output Matrices

Gary S. Anderson

April 24, 2007

Abstract

This note describes a Matlab program for solving linear rational expectation problems. The **gensysToAMA** program provides a version of the Anderson-Moore algorithm (AMA) that has a matrix interface exactly the same as the **gensys** program. The code allows the user to invoke the AMA solution code, a copy of their own version of **gensys**, or a copy of **gensys** that was available in early 2007. The code can also verify that the solutions obtained using **gensys** and AMA are equivalent. Timing tests reveal that, except for problems of small dimension, **gensysToAMA** computes solutions much more quickly than **gensys**.

1 Introduction and Summary

This note describes a Matlab program for solving linear rational expectation problems. The **gensysToAMA** program provides a version of the Anderson-Moore algorithm (AMA) that has a matrix interface exactly the same as the **gensys** program. The code allows the user to invoke the AMA solution code, a copy of their own version of **gensys**, or a copy of **gensys** that was available in early 2007. The code can also verify that the solutions obtained using **gensys** and AMA are equivalent. Timing tests reveal that, except for problems of small dimension, **gensysToAMA** computes solutions much more quickly than **gensys**.

2 Usage

2.1 Installation

1. **unzip the files** into a directory (*someDir*) accessible by Matlab. This will create a directory, **gensysToAMADist**, containing the **gensysToAMA** programs and some example .mat input matrix files.
2. start **matlab**
3. place the **gensysToAMA** directory on the Matlab path using
addpath someDir/gensysToAMADist
4. during a matlab session, you can run a quick test of the installation:

type

```
>>isGensysToAMAOK
```

to verify the **gensysToAMA** program functions correctly. After a few seconds, you should get a “**SUCCESS**” message.

2.2 Examples using gensysToAMA

The installation directory provides a number of “.mat” files that contain input matrices for the gensys (or gensysToAMA) program. These models vary in size and required computation time. For example, the two canada “.mat” files characterize the largest models and require the most computation time. Typing “help gensysToAMA” provides information on the gensysToAMA inputs and outputs.

2.2.1 Run both algorithms on a small model

```
                                gensysToAMA Example
>> load inp
>> who

Your variables are:

cc      div      g0      g1      hmat      nlags      pi      psi

>> [ggg,ccc,iii,fff,ffw,yyw,gev,eue]=gensysToAMA(g0,g1,cc,psi,pi,1.0,'both');
gensysToAMA:running both ama and gensys for comparison
problem dimensions: g0:10 x 10, psi:10 x 2, pi:10 x 5
gensysToAMA:running ama
gensysToAMA:converting ama output to gensys format
gensysToAMA:running gensys
gensysToAMA: trying gensys on your matlab path
gensysToAMA: that failed, using gensys2007 in gensysToAMA dir
gensysToAMA:runs complete
no difference in sims and AMA results
AMATime=1.562500e-002 AMAFTime=0   convertToTime=0 convertFromTime=0 genSysTime=0
>>
```

2.2.2 Large models much faster with AMA

```
                                gensysToAMA Example
>> load canada2lagas1.mat
>> [ggg,ccc,iii,fff,ffw,yyw,gev,eue]=gensysToAMA(g0,g1,cc,psi,pi,1.0,'both');
gensysToAMA:running both ama and gensys for comparison
problem dimensions: g0:222 x 222, psi:222 x 1, pi:222 x 111
gensysToAMA:running ama
gensysToAMA:converting ama output to gensys format
gensysToAMA:running gensys
gensysToAMA: trying gensys on your matlab path
gensysToAMA: that failed, using gensys2007 in gensysToAMA dir
gensysToAMA:runs complete
no difference in sims and AMA results
AMATime=8.593750e-001 AMAFTime=4.687500e-002
convertToTime=3.125000e-002 convertFromTime=9.375000e-002
genSysTime=4.273438e+001
>>
```

3 Problem Statement and Notation

These algorithms compute solutions for models of the form

$$\sum_{i=-\tau}^{\theta} H_i x_{t+i} = \psi z_t, t = 0, \dots, \infty \quad (1)$$

with initial conditions, if any, given by constraints of the form

$$x_i = x_i^{data}, i = -\tau, \dots, -1 \quad (2)$$

where both τ and θ are non-negative, and x_t is an L dimensional vector of endogenous variables with

$$\lim_{t \rightarrow \infty} \|x_t\| < \infty \quad (3)$$

and z_t is a k dimensional vector of exogenous variables.

(4)

Solutions can be cast in the form

$$(x_t - x^*) = \sum_{i=-\tau}^{-1} B_i(x_{t+i} - x^*) \quad (5)$$

Given any algorithm that computes the B_i , one can easily compute other quantities useful for characterizing the impact of exogenous variables. For models with $\tau = \theta = 1$ the formulae are especially simple.

Let

$$\phi = (H_0 + H_1 B_1)^{-1} \quad (6)$$

$$F = -\phi H_1 B \quad (7)$$

We can write

$$(x_t - x^*) = B_1(x_{t-1} - x^*) + \sum_{s=0}^{\infty} F^s \phi \psi z_{t+s} \quad (8)$$

and when

$$z_{t+1} = \Upsilon z_t \quad (9)$$

$$vec(\vartheta) = (I - \Upsilon^T \otimes F)^{-1} vec(\phi \psi) \quad (10)$$

$$(x_t - x^*) = B_1(x_{t-1} - x^*) + \vartheta z_t \quad (11)$$

Consult Anderson [1997] for other useful formulae concerning rational expectations model solutions.

4 Algorithmic Solution Concepts

The following sections present the inputs and outputs for each of the algorithms for the following simple example:

$$V_{t+1} = (1 + R)V_t - D_{t+1} \quad (12)$$

$$D = (1 - \delta)D_{t-1} \quad (13)$$

4.1 Anderson-Moore

Inputs		
$\sum_{i=-\tau}^{\theta} H_i x_{t+i} = \psi z_t \quad (14)$		
(15)		
Model Variable	Description	Dimensions
$x_{t-\tau}, \dots, x_t, \dots, x_{t+\theta}$	Model Variables	$L(\tau + \theta) \times 1$
z_t	Exogenous Variables	$M \times 1$
θ	Longest Lead	1×1
τ	Longest Lag	1×1
H_i	Structural Coefficients Matrix	$(L \times L)(\tau + \theta + 1)$
ψ	Exogenous Shock Coefficients Matrix	$L \times M$
Υ	Optional Exogenous VAR Coefficients Matrix ($z_{t+1} = \Upsilon z_t$)	$M \times M$
Outputs		
$x_t = B \begin{bmatrix} x_{t-\tau} \\ \vdots \\ x_{t-1} \end{bmatrix} + [0 \quad \dots \quad 0 \quad I] \sum_{s=0}^{\infty} (F^s \begin{bmatrix} 0 \\ \phi \psi z_{t+s} \end{bmatrix}) \quad (16)$		
(17)		
Model Variable	Description	Dimensions
B	reduced form coefficients matrix	$L \times L(\tau + \theta)$
ϕ	exogenous shock scaling matrix	$L \times L$
F	exogenous shock transfer matrix	$L\theta \times L\theta$
ϑ	autoregressive shock transfer matrix when $z_{t+1} = \Upsilon z_t$ the infinite sum simplifies to give $x_t = B \begin{bmatrix} x_{t-\tau} \\ \vdots \\ x_{t-1} \end{bmatrix} + \vartheta z_t$	$L \times M$

Anderson-Moore input:

AIM Modeling Language Input
Parameter File Input

$$H = \begin{bmatrix} 0 & 0 & -1.1 & 0 & 1 & 1. \\ 0 & -0.7 & 0 & 1 & 0 & 0. \end{bmatrix}, \psi = \begin{bmatrix} 4. & 1. \\ 3. & -2. \end{bmatrix}, \Upsilon = \begin{bmatrix} 0.9 & 0.1 \\ 0.05 & 0.2 \end{bmatrix} \quad (18)$$

produces output:

$$B = \begin{bmatrix} 0. & 1.225 \\ 0. & 0.7 \end{bmatrix} F = \begin{bmatrix} 0.909091 & 0.909091 \\ 0. & 0. \end{bmatrix} \phi = \begin{bmatrix} -0.909091 & 1.75 \\ 0. & 1. \end{bmatrix} \quad (19)$$

$$\phi \psi = \begin{bmatrix} 1.61364 & -4.40909 \\ 3. & -2. \end{bmatrix} \vartheta = \begin{bmatrix} 21.0857 & -3.15714 \\ 3. & -2. \end{bmatrix} \quad (20)$$

Usage Notes for Anderson-Moore Algorithm

1. “Align” model variables so that the data history (without applying model equations), completely determines all of x_{t-1} , but none of x_t .
2. Develop a “model file” containing the model equations written in the “AIM modeling language”
3. Apply the model pre-processor to create MATLAB programs for initializing the algorithm’s input matrix, (H) . Create Ψ and, optionally, Υ matrices.
4. Execute the MATLAB programs to generate B , ϕ , F and optionally ϑ

Users can obtain code for the algorithm and the preprocessor from the author¹

4.2 Sims

Inputs		
$\Gamma_0 y_t = \Gamma_1 y_{t-1} + C + \psi z_t + \Pi \eta_t$ (21)		
(22)		
Model Variable	Description	Dimensions
y_t	State Variables	$L \times 1$
z_t	Exogenous Variables	$M_1 \times 1$
η_t	Expectational Error	$M_2 \times 1$
Γ_0	Structural Coefficients Matrix	$L \times L$
Γ_1	Structural Coefficients Matrix	$L \times L$
C	Constants	$L \times 1$
ψ	Structural Exogenous Variables Coefficients Matrix	$L \times M_1$
Π	Structural Expectational Errors Coefficients Matrix	$L \times M_2$
Outputs		
$y_t = \Theta_1 y_{t-1} + \Theta_c + \Theta_0 z_t + \Theta_y \sum_{s=1}^{\infty} \Theta_f^{s-1} \Theta_z E_t z_{t+s}$ (23)		
(24)		
Model Variable	Description	Dimensions
Θ_1		$L \times L$
Θ_c		$L \times 1$
Θ_0		$L \times M_1$
Θ_y		$L \times M_2$
Θ_f		$M_2 \times M_2$
Θ_z		$M_2 \times M_1$

¹ <http://www.bog.frb.fed.us/pubs/oss/oss4/aimindex.html> July, 1999.

Sims input:

$$\Gamma_0 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ -1.1 & 0 & 1 & 1. \\ 0 & 1 & 0 & 0 \end{bmatrix}, \Gamma_1 = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0.7 & 0 & 0 \end{bmatrix}, C = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \quad (25)$$

$$\psi = \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 4. & 1. \\ 3. & -2. \end{bmatrix}, \Pi = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \quad (26)$$

(27)

produces output:

$$\Theta_c \begin{bmatrix} 0. \\ 0. \\ 0. \\ 0. \end{bmatrix}, \Theta_0 = \begin{bmatrix} 1.61364 & -4.40909 \\ 3. & -2. \\ 3.675 & -2.45 \\ 2.1 & -1.4 \end{bmatrix}, \Theta_f = \begin{bmatrix} 0.909091 & 1.23405 \\ 0. & 0. \end{bmatrix}, \quad (28)$$

$$\Theta_y = \begin{bmatrix} 1.28794 & 1.74832 \\ -2.2204510^{-16} & -1.1102210^{-16} \\ 1.41673 & 0.702491 \\ -1.1102210^{-16} & 1.22066 \end{bmatrix}, \Theta_z = \begin{bmatrix} -0.0796719 & -2.29972 \\ 2.4577 & -1.63846 \end{bmatrix} \quad (29)$$

$$\Theta_y \Theta_z = \begin{bmatrix} 4.19421 & -5.82645 \\ -2.5516810^{-16} & 6.9254610^{-16} \\ 1.61364 & -4.40909 \\ 3. & -2. \end{bmatrix}, \quad (30)$$

5 Comparing Output and Computation Time

Anderson and Moore describe their algorithm in Anderson and Moore [1983]. Sims describes his algorithm in Sims [1996], Although they attack a the same class of problems their notation is different. Their computer codes reflect these notational differences. Section A.2 presents the code for converting gensys style input into the form expected by the Anderson-Moore algorithm. style input Section A.3 presents the code for converting Anderson-Moore style output into the form generated by the gensys program.

When running the code using the ‘both’ option, the code computes the two-norm of the difference between the gensys style output of the two programs.² In particular, the code verifies that the following two-norms are smaller than 1×10^{-8} .

$$\begin{aligned} \| G1_{gensys} - G1_{AMA} \| &< 1 \times 10^{-8} \\ \| CC_{gensys} - CC_{AMA} \| &< 1 \times 10^{-8} \\ \| impact_{gensys} - impact_{AMA} \| &< 1 \times 10^{-8} \end{aligned}$$

Comparing $fmat, fwt, ywt$ must account for that fact that applying any similarity transformation to $fmat$ and correspondingly adjusting ywt and fwt produces an equivalent solution. Consequently, the code verifies that

$$\begin{aligned} fmat_{gensys} \text{ is similar to } fmat_{AMA} \\ \| real(ywt_{gensys} fwt_{gensys}) - ywt_{AMA} fwt_{AMA} \| &< 1 \times 10^{-8} \\ \| real(ywt_{gensys} fmat_{gensys} fwt_{gensys}) - ywt_{AM} fmat_{AM} ywt_{AMA} \| &< 1 \times 10^{-8} \end{aligned}$$

²The code does not compare the outputs when the rational expectations model does not have a unique saddle point solution.
